Is Stellantis's product comeback real?

Charts in plain language, most reliable first

This report checks one investment idea: that Stellantis's new and updated vehicles and engines will bring in real buyers, so it can ship more vehicles without stuffing dealer lots or offering bigger discounts, which would let profits recover.

Each page has one chart and three short notes:

- What this shows: the finding in plain words
- How to read it: what the lines, dots or bars mean
- How strong: whether you can rely on it, and why

Pages are in order of how much you can trust them:

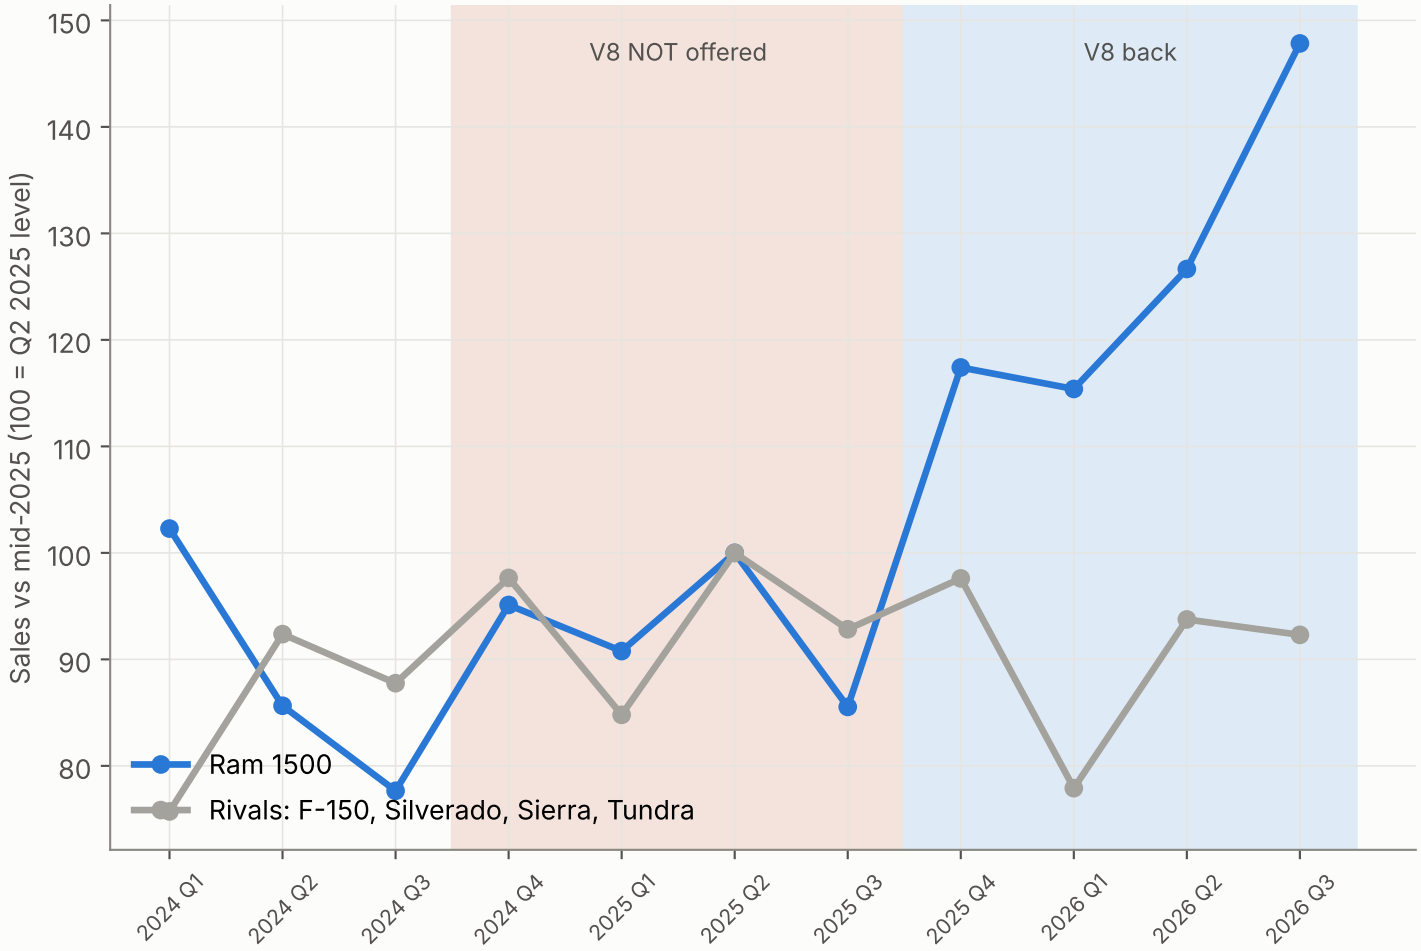

STRONG EVIDENCE - safe to use in a report (4 charts)

MODERATE EVIDENCE - use with a caveat (5 charts)

WEAK OR MESSY - background only, not enough proof (6 charts)

"Correlation" is how closely two things move together, from 0% (no link) to 100% (move in perfect step). A minus sign means one goes up while the other goes down. Moving together does not by itself prove that one causes the other.

When Ram brought its V8 engine back, Ram 1500 sales jumped well ahead of rival trucks

What this shows

Ram dropped its big V8 engine (the "Hemi") for about a year, then brought it back in late 2025. After it came back, Ram 1500 sales grew about 37% more than rival pickups did. Before that, Ram and its rivals had moved roughly together.

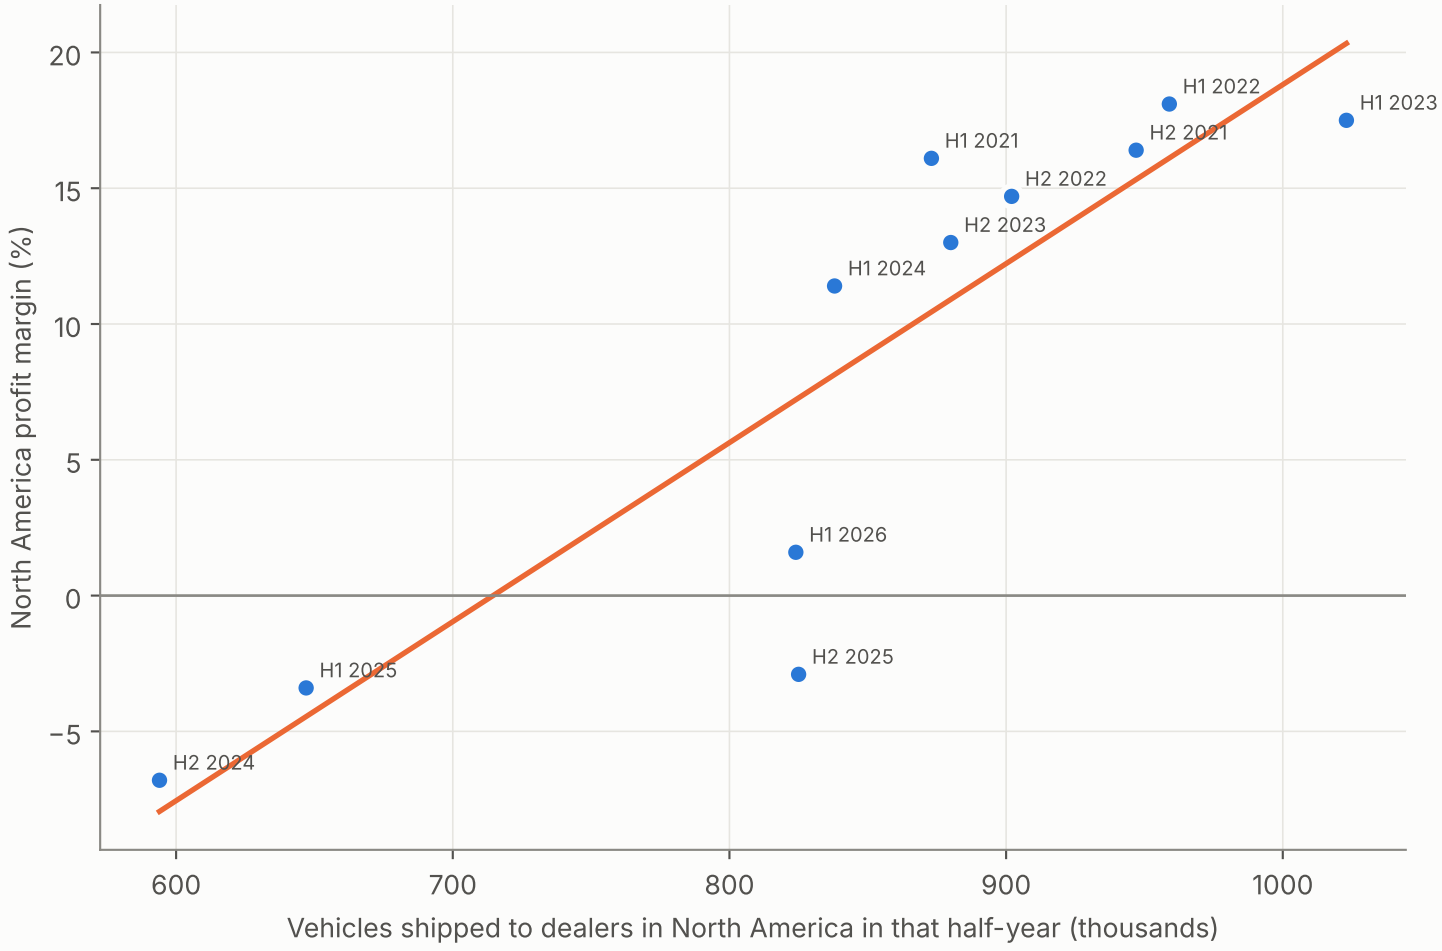

How to read it

Both lines start at 100 in mid-2025, so you can compare growth, not size. The blue line pulling above the gray line in the blue-shaded area is the V8 effect.

How strong is this?

Strong: clear jump, big gap, and the comparison with rivals removes normal market ups and downs. Caveat: much of the gain is Ram winning back buyers it lost when it removed the V8, and Ram cut prices at the same time.

The more vehicles Stellantis ships in North America, the higher its profit margin

What this shows

Each dot is a half-year. When Stellantis shipped more vehicles to dealers, it kept a much bigger share of each sales dollar as profit. Factories have big fixed costs, so running them fuller pays off.

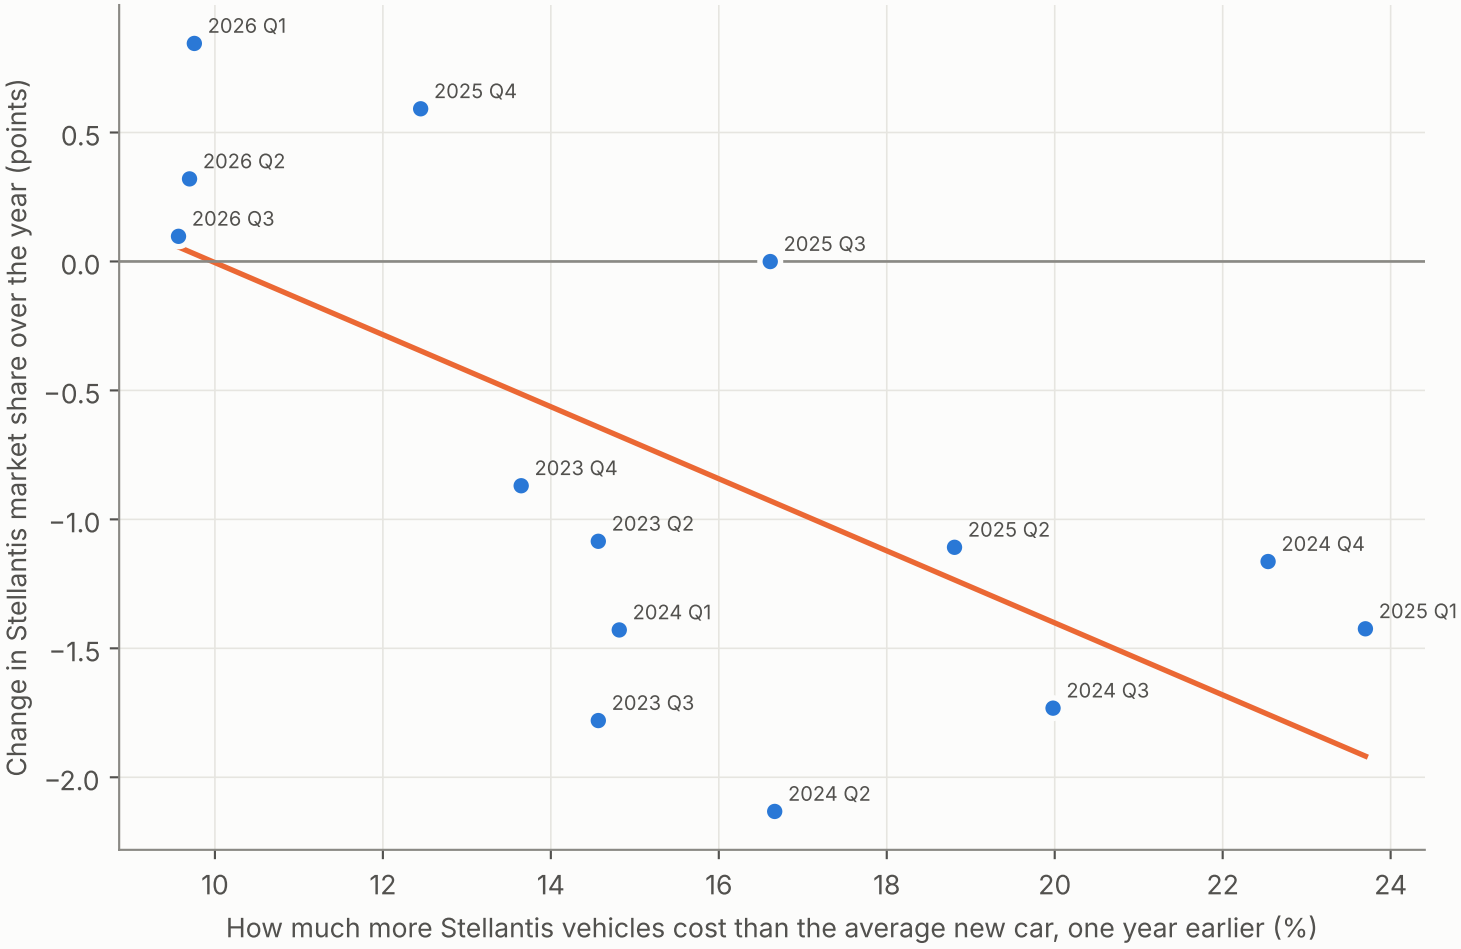

How to read it

Dots to the right = more vehicles shipped. Higher dots = more profit per dollar of sales. The line slopes up steeply.

How strong is this?

Strong: tight pattern (correlation 90%). About 100,000 extra vehicles per half-year goes with roughly 6.5 points more margin. Caveat: 2024-25 also had one-off costs (tariffs, warranty charges).

When Stellantis prices its vehicles far above the market, it loses market share the following year

What this shows

Each dot is a quarter. When Stellantis vehicles were much pricier than the average new car, its share of US sales dropped over the next year. Its price gap peaked at about 24% in early 2024, and its market share fell from about 10.6% to 7.4%.

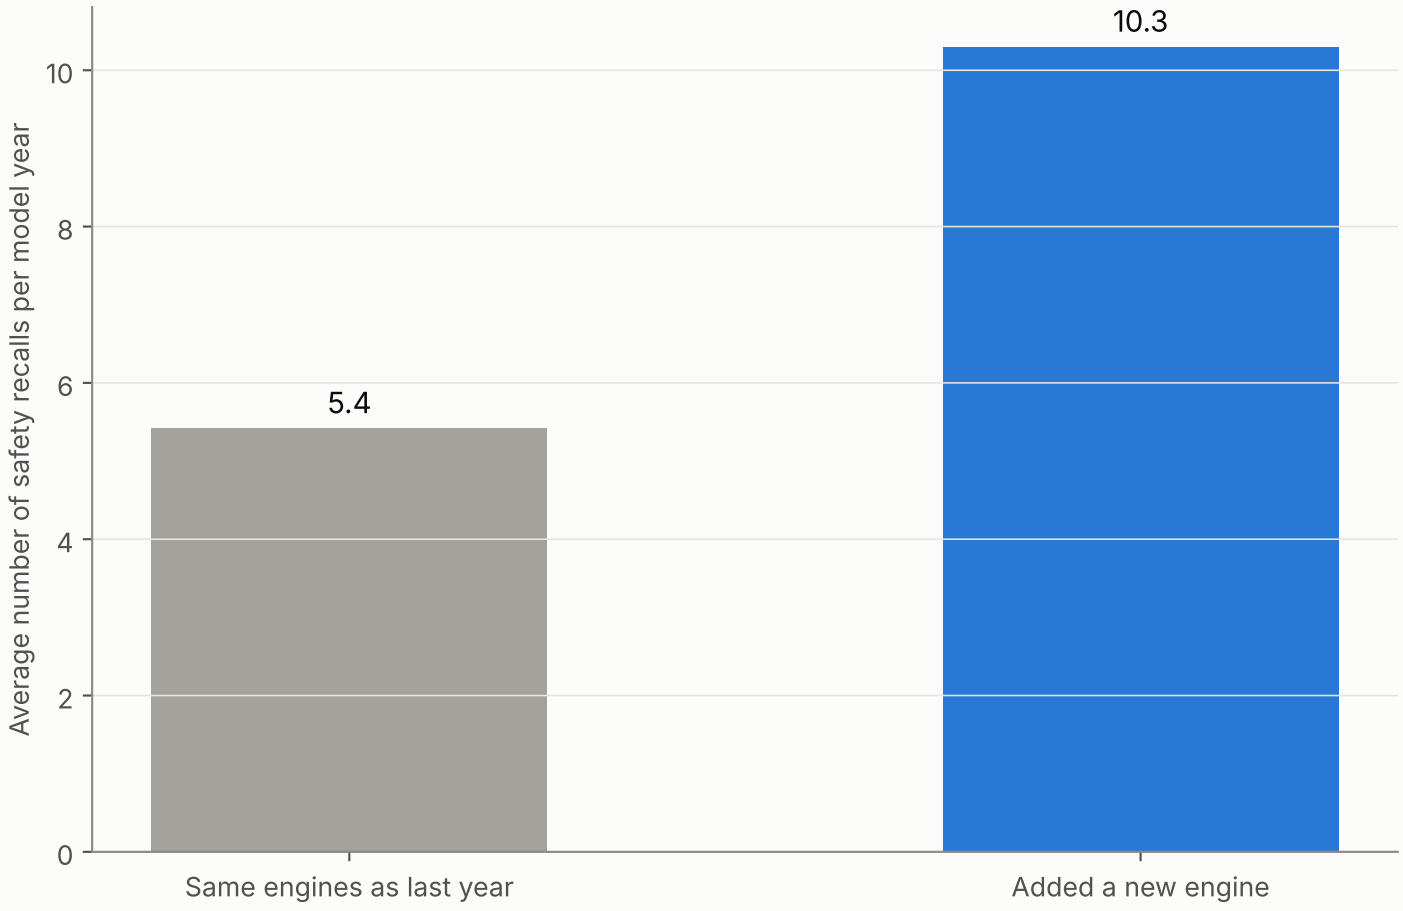

How to read it

Dots to the right = Stellantis was priced further above the market. Lower dots = bigger share loss a year later.

How strong is this?

Strong for this question (correlation -66%, unlikely to be chance), but only 14 quarters of data. It is a warning sign for any plan that relies on high prices.

Model years that introduce a new engine get noticeably more safety recalls

What this shows

Using government recall records, model years where a Stellantis vehicle got a new engine averaged about 10 recalls, versus about 5 for model years with the same engines as before.

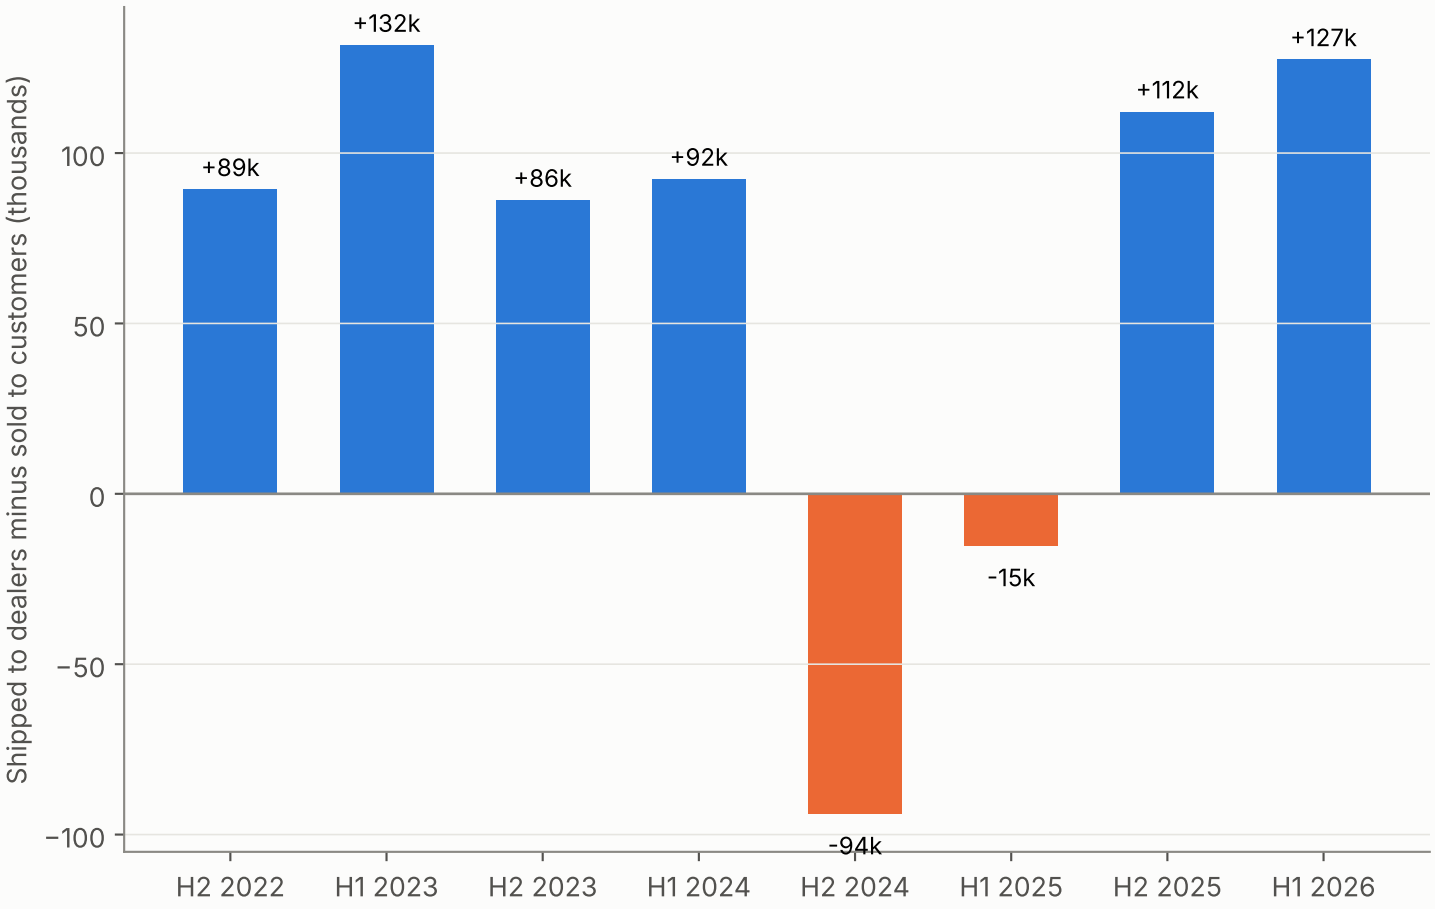

How to read it

Compare the two bars. Taller = more recalls. Recalls cost money (repairs, warranty), which eats into profit.

How strong is this?

Strong: even after comparing each model only with its own other years, new-engine years have about 1.5 times as many recalls (very unlikely to be chance). Caveat: it counts recall campaigns, not how many cars were affected.

Stellantis is again shipping more vehicles to dealers than customers are buying

What this shows

In late 2024 Stellantis shipped fewer vehicles than it sold, to clear out crowded dealer lots (orange bar). Since mid-2025 it has been shipping 112,000-127,000 more vehicles than US and Canadian customers bought per half-year.

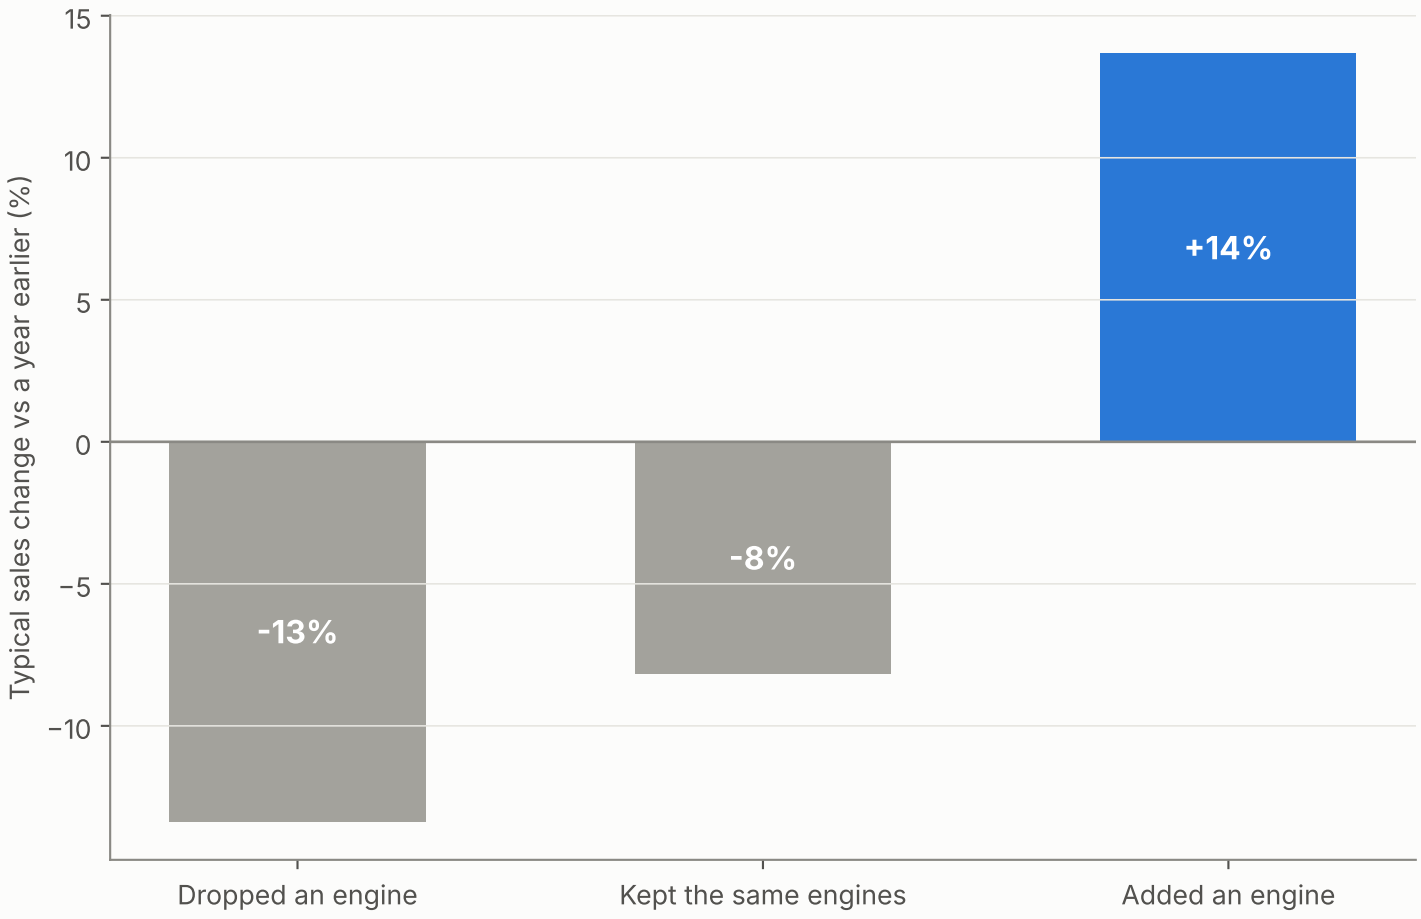

How to read it

Bars above zero = more shipped than sold (dealer lots filling up). Below zero = lots being cleared out.

How strong is this?

Moderate: the numbers are official, but this includes Mexico sales, which Stellantis does not report separately. Current levels are similar to 2022-2024, so this is a watch item, not proof of a problem.

Models that add an engine option tend to sell better the next year

What this shows

Across about 20 Stellantis models from 2021 to 2026, models that added an engine option typically grew about 14% in a year. Models that kept the same engines shrank about 8%, and models that dropped one shrank about 13%.

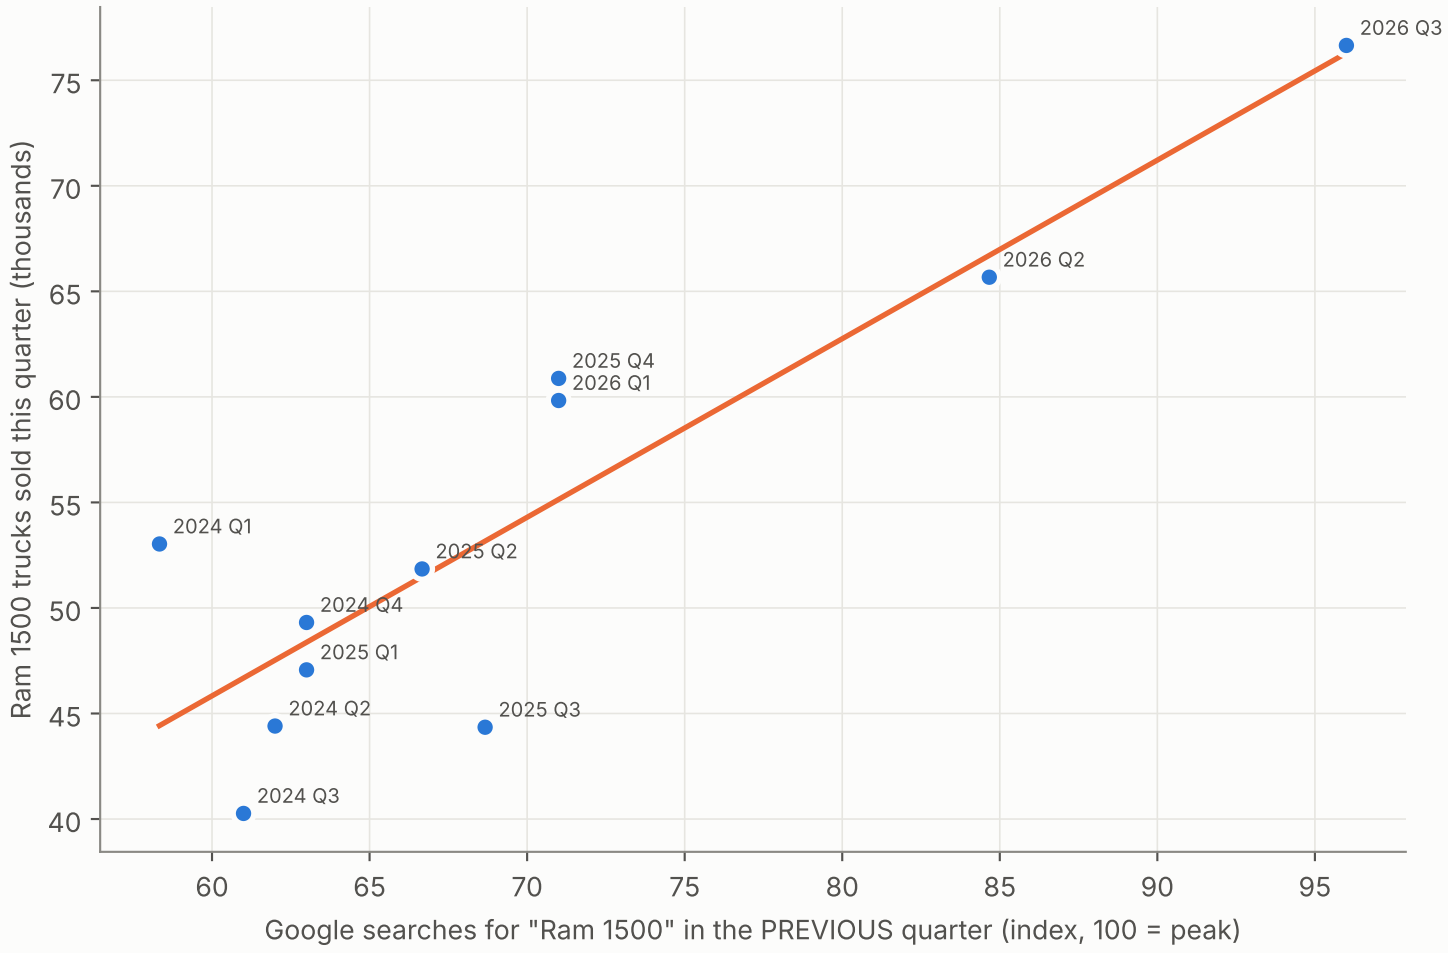

How to read it

Each bar is the typical (median) sales change for that group. Blue is the group that added an engine.

How strong is this?

Moderate: the pattern is clear, but the statistical test is borderline (about 5% chance it is luck). Stellantis may add engines to models it already expects to sell well.

Google searches for "Ram 1500" give an early read on Ram 1500 sales

What this shows

Each dot is a quarter. When more people searched "Ram 1500", more Ram 1500 trucks were sold in the following quarter. This can be checked free each month, before Stellantis reports its sales.

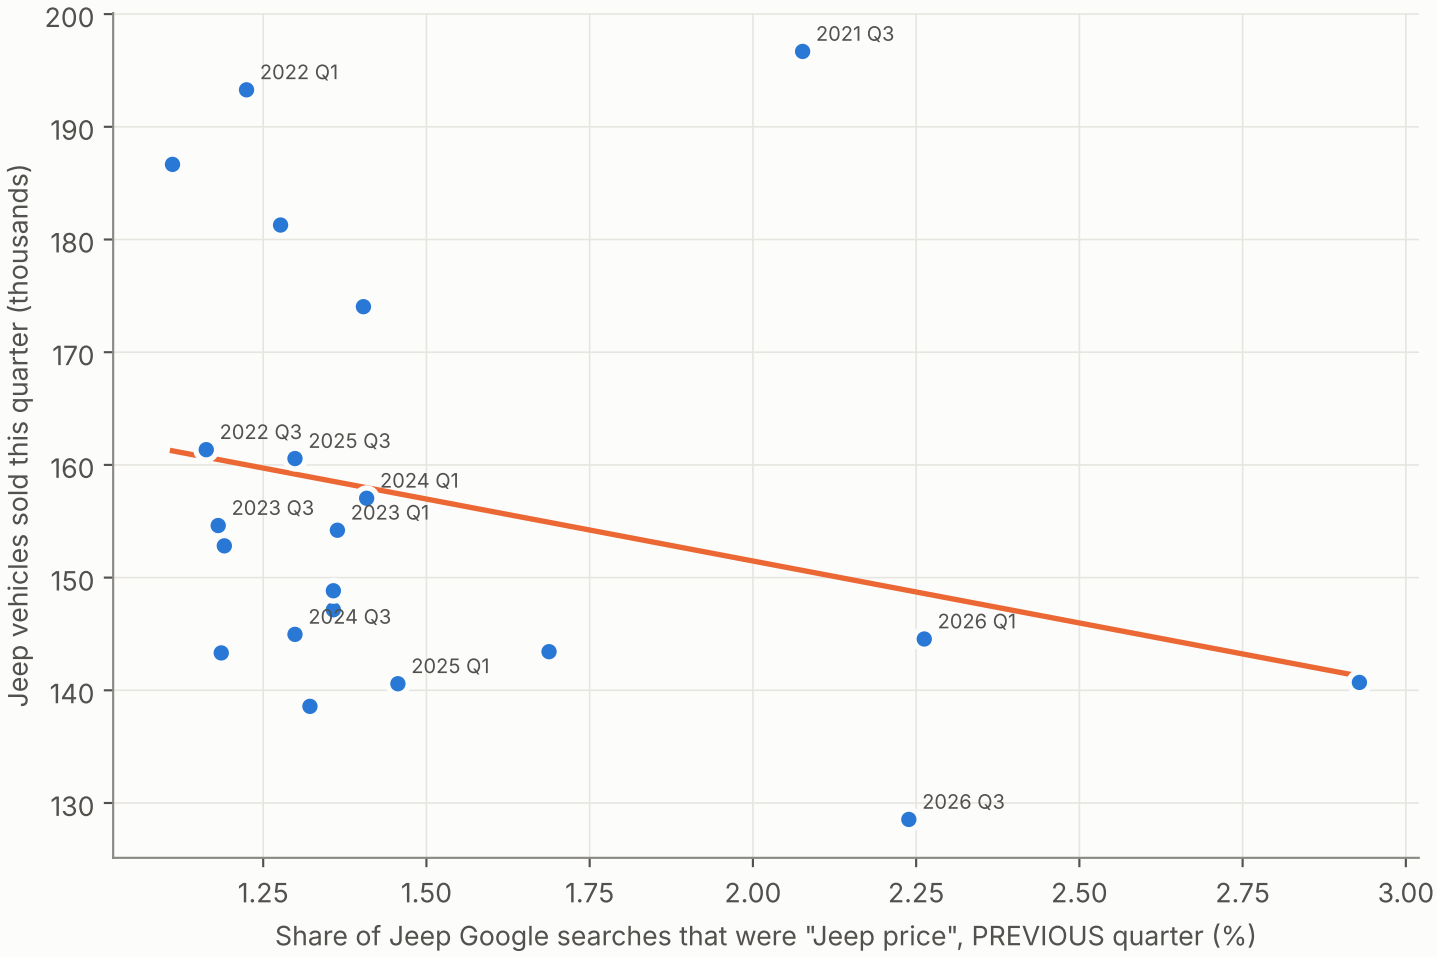

How to read it

Dots to the right = more searching last quarter. Higher dots = more trucks sold this quarter.

How strong is this?

Moderate: the pattern is strong, but there are only 10 quarters. Searches for "Ram Hemi" specifically did NOT predict sales.

When more people google "Jeep price", Jeep sales tend to drop the next quarter

What this shows

Each dot is a quarter. When a bigger share of Jeep searches were about price, Jeep sold fewer vehicles the next quarter, about 10% fewer per extra point. That suggests shoppers balking at Jeep prices.

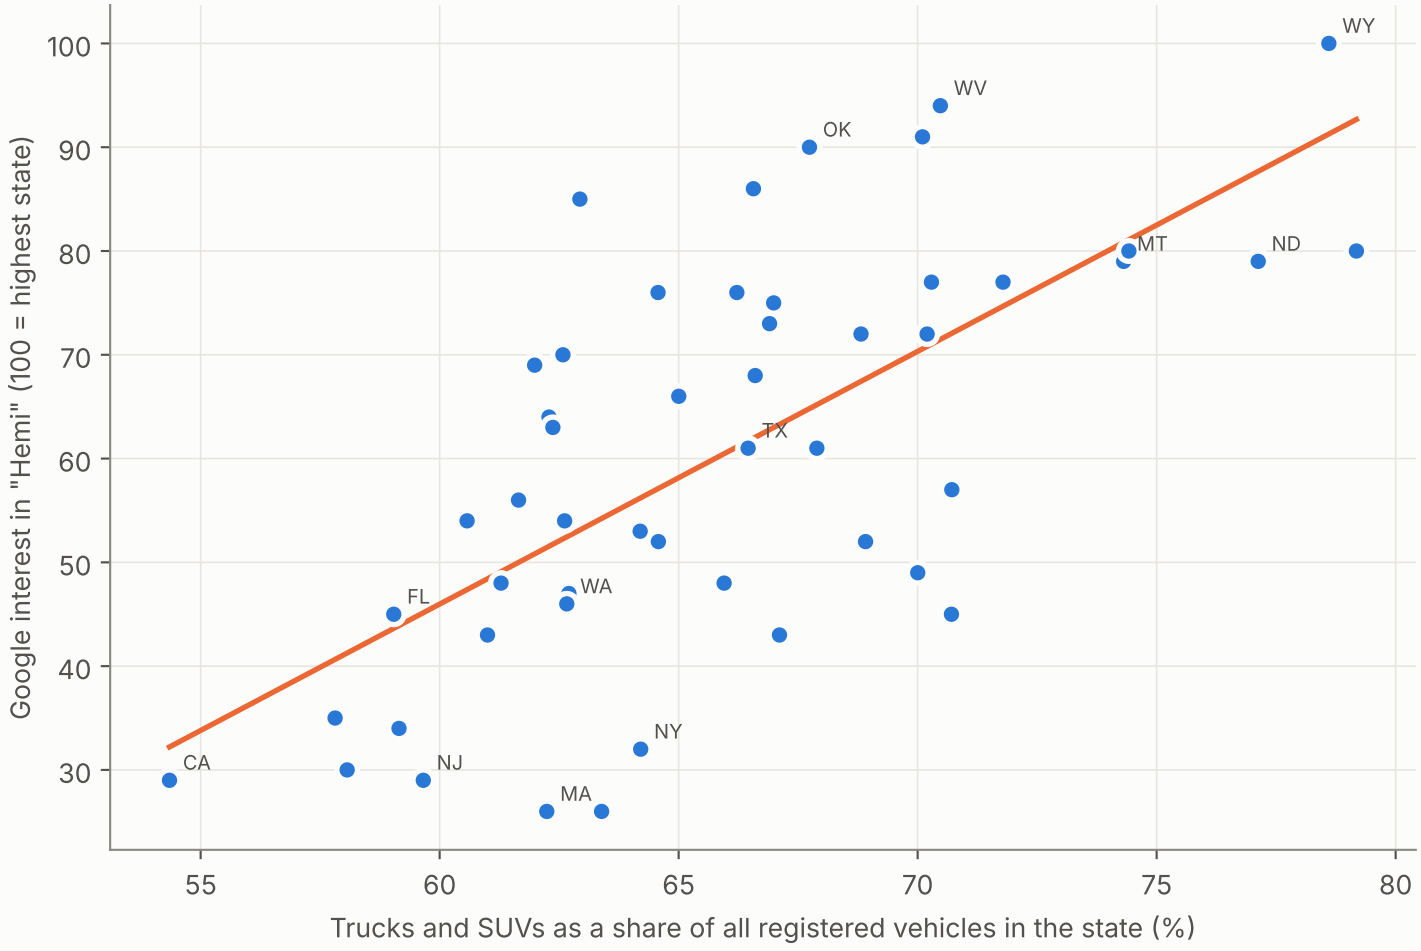

How to read it

Dots to the right = more price-searching. Lower dots = fewer Jeeps sold the next quarter.

How strong is this?

Moderate: statistically solid (about 1% chance it is luck), but only 20 quarters, and searches are an indirect signal.

Interest in the V8 "Hemi" is highest in truck-heavy states

What this shows

States where trucks and SUVs make up more of the vehicles on the road search much more for "Hemi". Lower-income states also search more. This tells you where to look for V8 buyers.

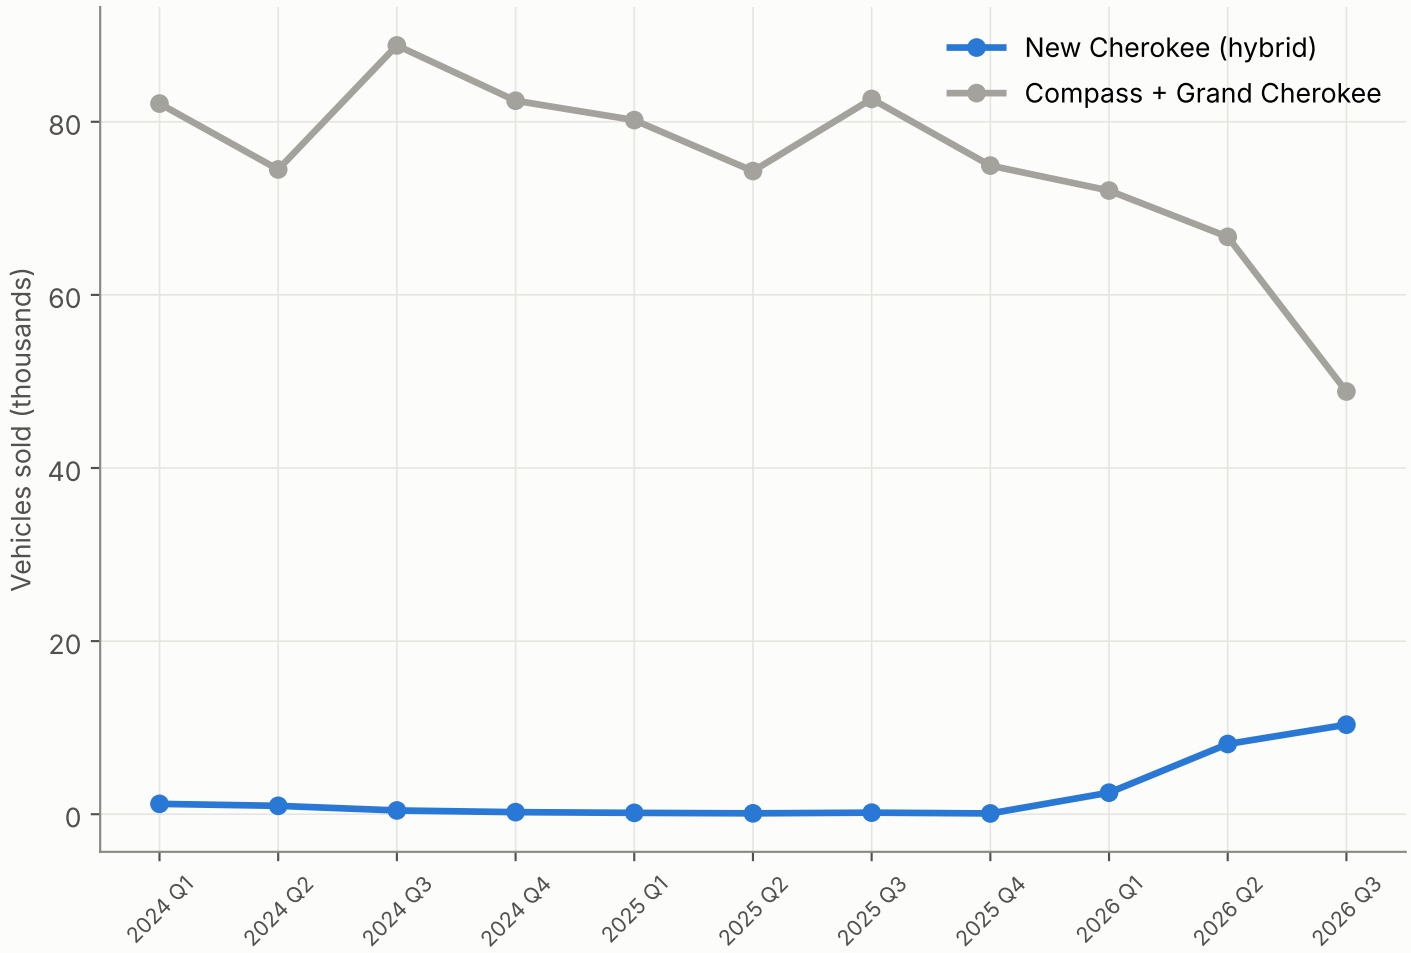

How to read it

Each dot is a state. Further right = more trucks registered. Higher = more Hemi interest.

How strong is this?

Moderate: a clear pattern across 50 states (correlation 67%), but it measures interest, not actual purchases. Use it to choose which cities to track dealer inventory in.

The new Cherokee may be taking buyers from other Jeeps

What this shows

As the new Cherokee hybrid started selling in 2026, sales of the Compass and Grand Cherokee fell sharply. That could mean Cherokee is stealing buyers from them instead of bringing in new ones.

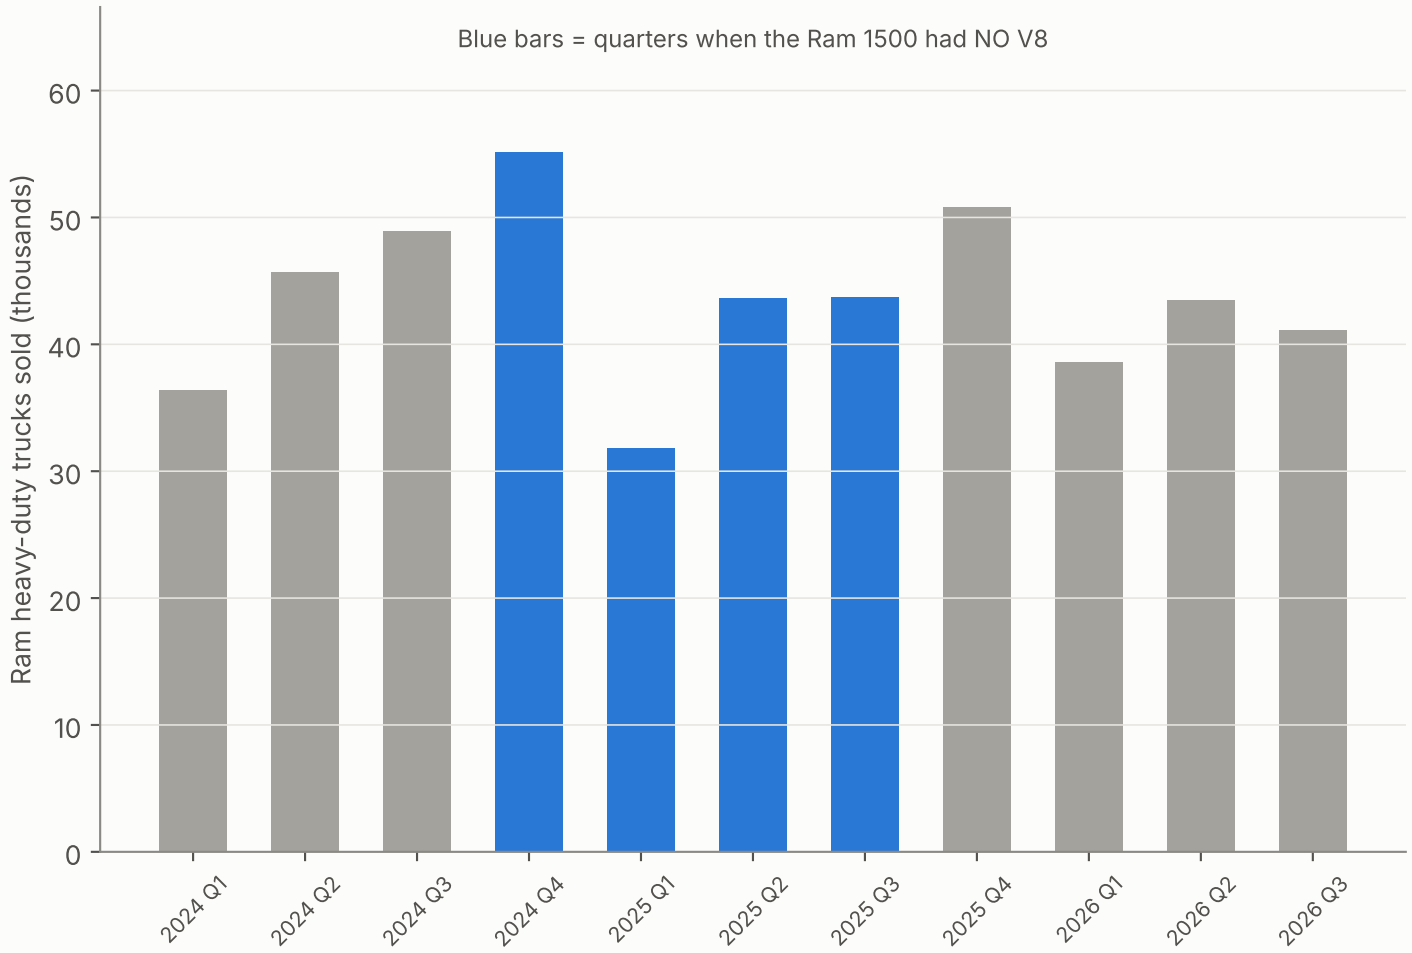

How to read it

Blue line = new Cherokee rising. Gray line = Compass + Grand Cherokee falling.

How strong is this?

Weak: Stellantis also shut down Compass and Grand Cherokee production in this period, so the drop may be supply, not lost buyers. Only 4 quarters of Cherokee sales so far.

Ram's bigger heavy-duty trucks may sell slightly less when the V8 is available on the Ram 1500

What this shows

When the 1500 had no V8 (blue bars), some buyers who wanted a V8 may have bought the bigger, pricier heavy-duty Ram instead. Heavy-duty sales ran about 6% lower when the V8 was available.

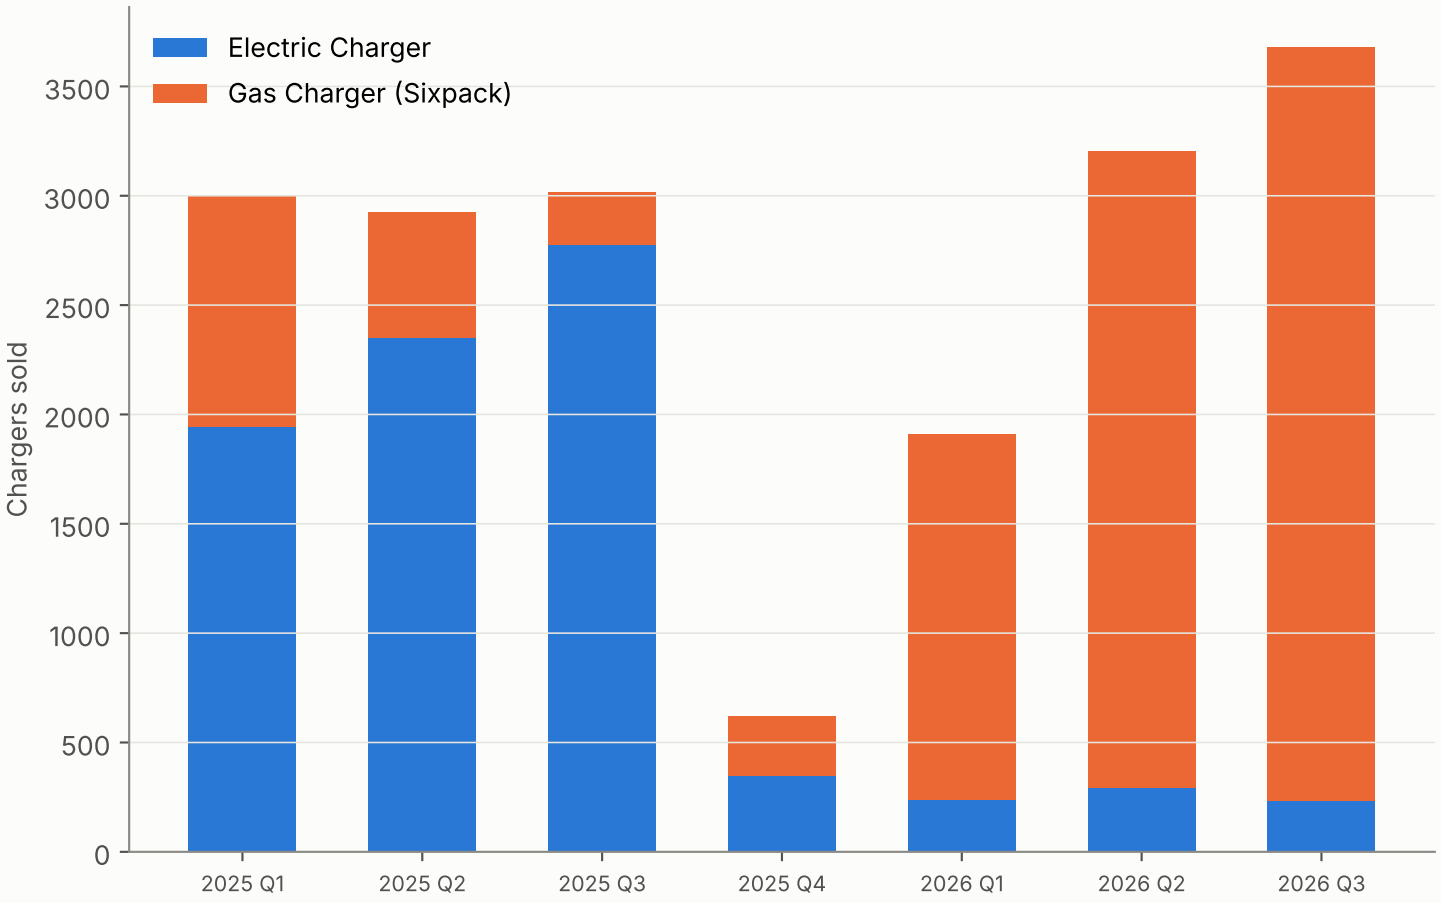

How to read it

Compare blue bars (no V8 on the 1500) with gray bars (V8 offered).

How strong is this?

Weak: the difference is small and could easily be chance (only 11 quarters).

The gas-powered Charger is replacing the electric one more than it is adding buyers

What this shows

Dodge's new gas Charger started selling in late 2025, and electric Charger sales collapsed at the same time. The total number of Chargers sold rose only modestly.

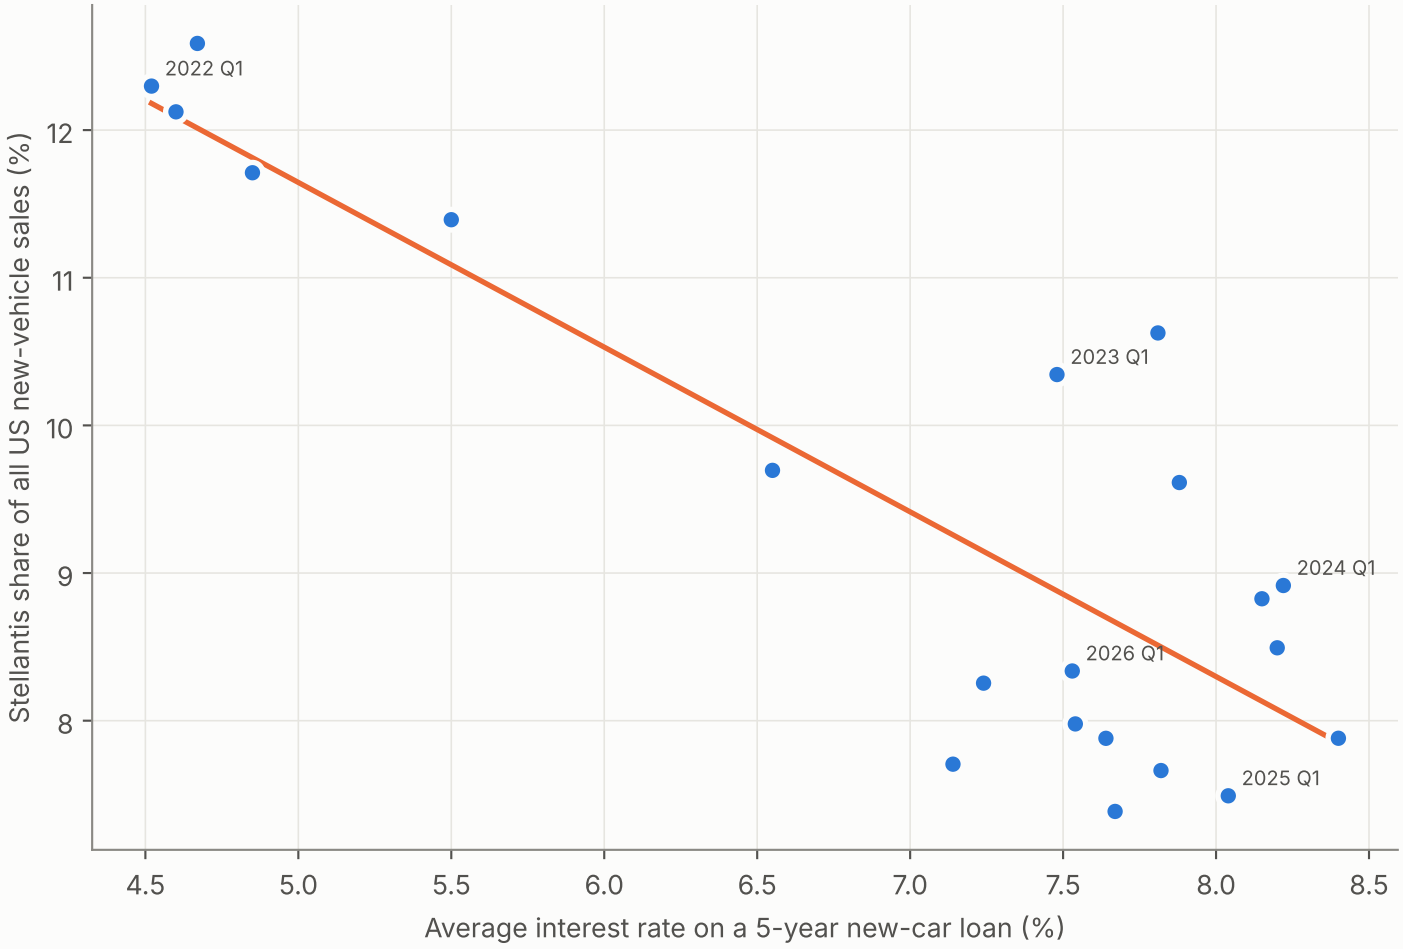

How to read it

Each bar is a quarter. Blue = electric, orange = gas. Watch the blue shrink as the orange grows.

How strong is this?

Weak: only 7 quarters, and the federal EV tax credit ended at the same time (Sept 2025), which also hurt electric sales.

Stellantis's market share fell as car-loan interest rates rose

What this shows

Each dot is a quarter. Higher loan rates went with a lower Stellantis share of US sales, which would suggest its buyers are more sensitive to borrowing costs than other brands'.

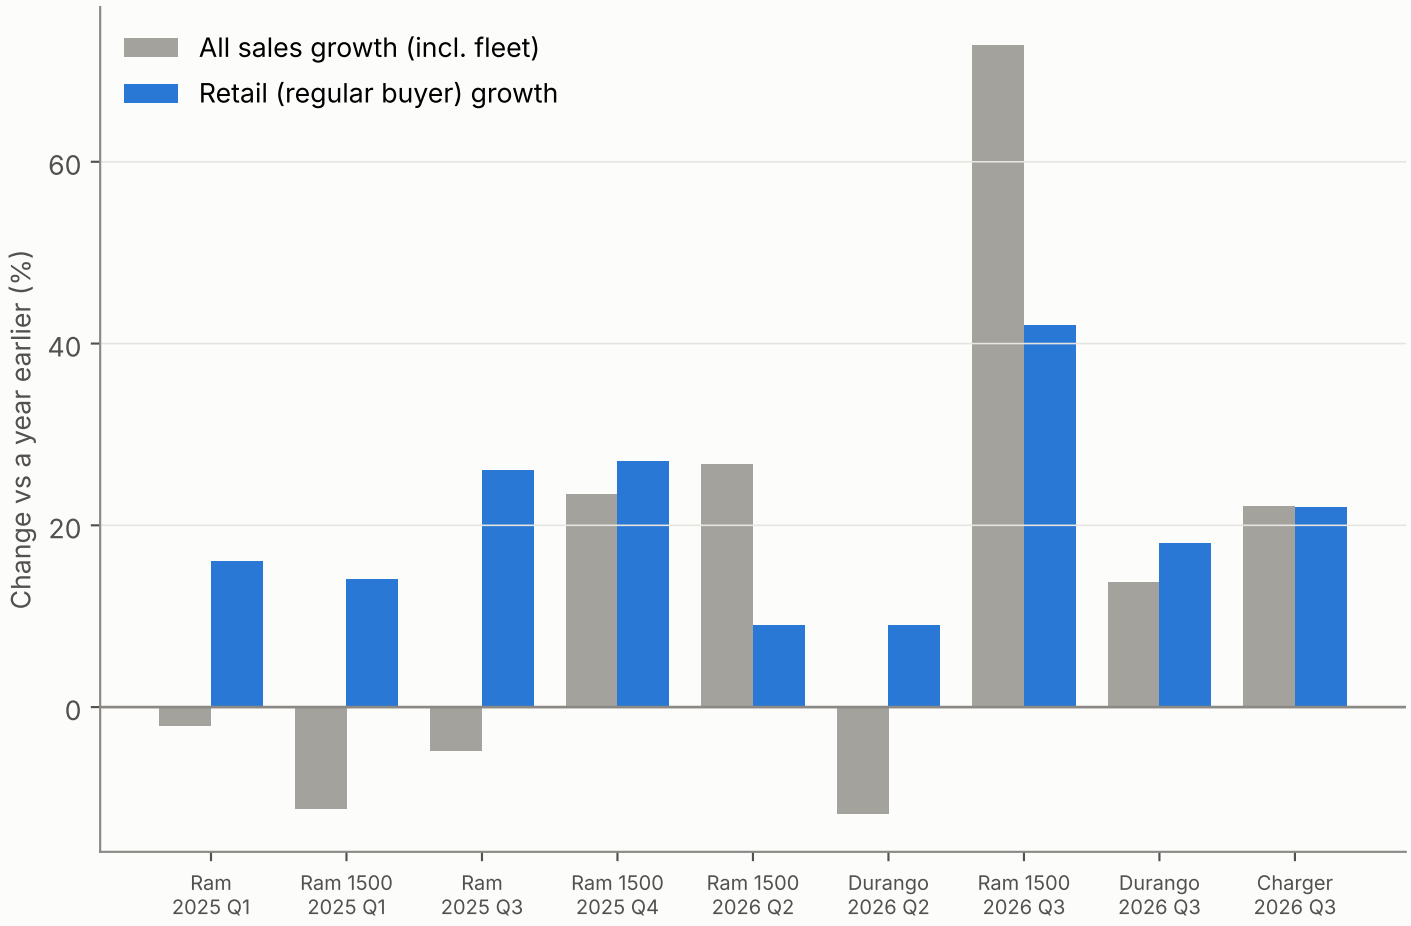

How to read it

Dots to the right = more expensive car loans. Lower dots = smaller Stellantis market share.

How strong is this?

Weak: Stellantis was losing share at the same time for other reasons (mainly high prices), so the two cannot be separated. When compared directly with total market sales, the rate effect disappears.

When new engines launch, fleet sales may be inflating the totals

What this shows

For new-engine launches, total sales (which include rental and business fleets) often grew faster than sales to regular shoppers. For example, the Ram 1500 in Q3 2026: total +73%, regular shoppers +42%.

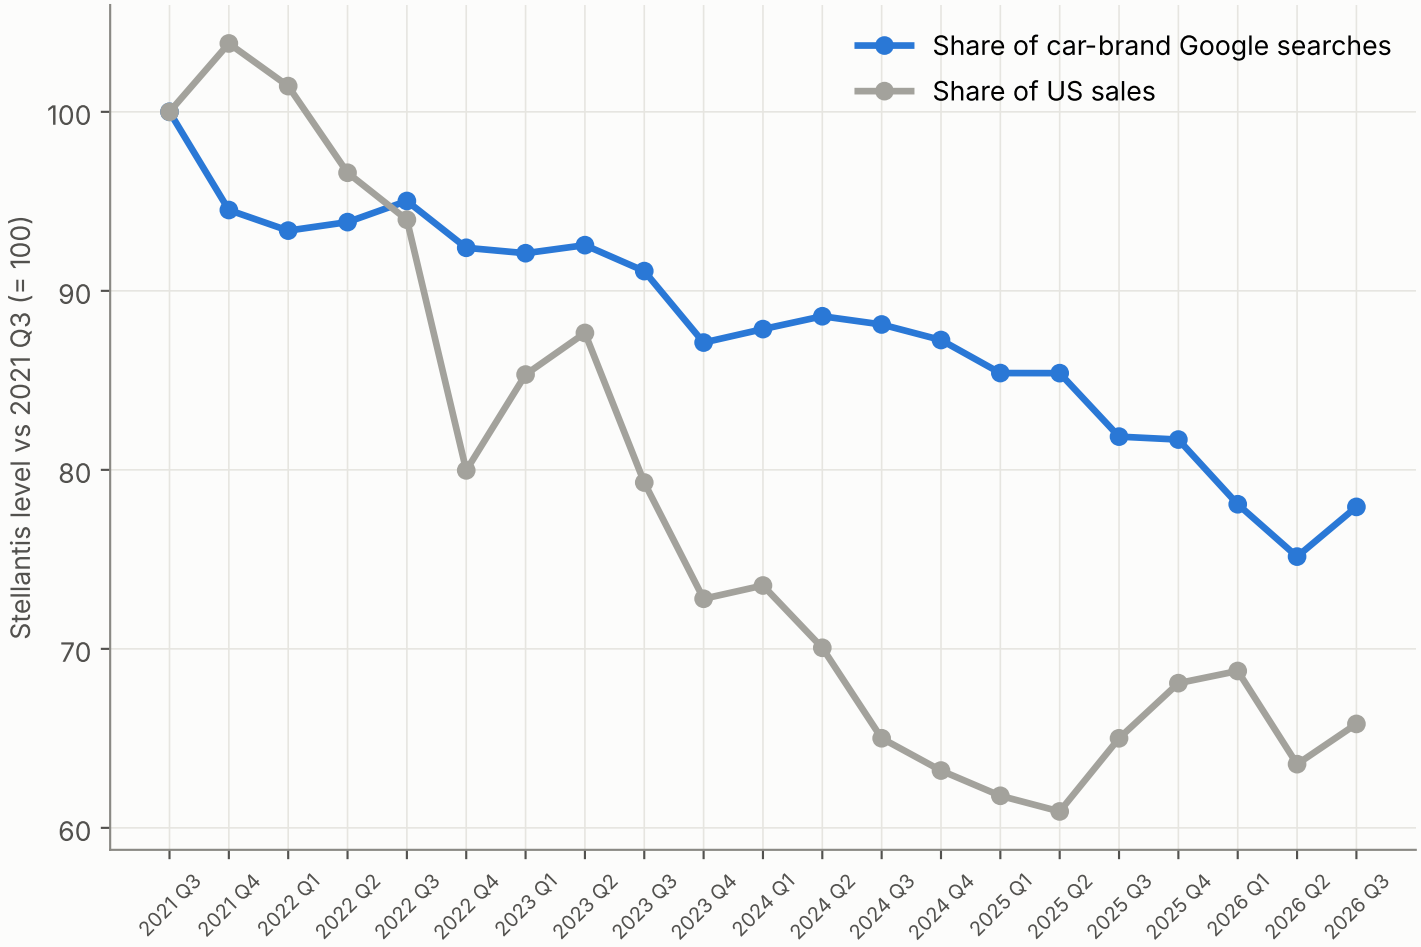

How to read it

Gray = all sales growth. Blue = regular-shopper growth. A gray bar much taller than blue means fleet is filling the gap.

How strong is this?

Weak: Stellantis only gives regular-shopper growth in a few press releases (hand-collected), and the difference is not statistically reliable.

Stellantis's share of car-brand searches moves with its share of sales

What this shows

Stellantis's share of Google searches for car brands (vs Ford and Toyota) fell and recovered roughly in step with its share of US sales.

How to read it

Both lines start at 100. When they move together, search interest is tracking sales.

How strong is this?

Weak for decision-making: both were falling over the same years, so they move together without one causing the other.

How I would use this

The strong findings are the core of the case. The V8's return shows that the right engine brings Ram buyers back. Shipping more vehicles clearly lifts profit margins. Pricing too far above the market costs share. New engines bring more recalls, which cost money. The moderate findings are the early-warning gauges to check each month or quarter: "Ram 1500" and "Jeep price" Google searches, and whether shipments keep running well ahead of sales. The idea holds up if sales to regular shoppers keep growing, the gap between shipments and sales stays near its 2022-24 level, and Stellantis prices stay close to the market. It weakens if any of those reverse. The biggest missing piece is direct proof about dealer lots and discounts. The next step is to record dealer websites every week, starting in truck-heavy cities, to see which vehicles sell fast, which sit, and how big the discounts are. Weak findings stay out of the report unless that new data confirms them.
